

Problem 4

假定四则运算均为实数域上的运算，求出包含 $\alpha = \sqrt{2} + \sqrt{3}$ 的最小的域。
即求域 $\mathbb{F}_0$ 使得：

- ① $\alpha \in \mathbb{F}_0$
- ② 对于任意满足 $\alpha \in \mathbb{F}$ 的域 $\mathbb{F}$ 都有 $\mathbb{F}_0 \subset \mathbb{F}$

Solution:

首先我们证明有理数域 $\mathbb{Q}$ 加上 $\sqrt{2}, \sqrt{3}$ 的扩张

$$\mathbb{F}_0 := \mathbb{Q}[\sqrt{2}, \sqrt{3}] = \{q_1 + q_2\sqrt{2} + q_3\sqrt{3} + q_4\sqrt{6} : q_1, q_2, q_3, q_4 \in \mathbb{Q}\}$$

是一个包含 $\alpha = \sqrt{2} + \sqrt{3}$ 的数域。

$$\text{对于任意 } \begin{cases} a = a_1 + a_2\sqrt{2} + a_3\sqrt{3} + a_4\sqrt{6} \\ b = b_1 + b_2\sqrt{2} + b_3\sqrt{3} + b_4\sqrt{6} \\ c = c_1 + c_2\sqrt{2} + c_3\sqrt{3} + c_4\sqrt{6} \end{cases} \in \mathbb{F}_0 \text{ (其中 } a_1, a_2, a_3, a_4, b_1, b_2, b_3, b_4, c_1, c_2, c_3, c_4 \in \mathbb{Q})$$

我们都有：

- **封闭:**

$$\begin{aligned} a + b &= (a_1 + a_2\sqrt{2} + a_3\sqrt{3} + a_4\sqrt{6}) + (b_1 + b_2\sqrt{2} + b_3\sqrt{3} + b_4\sqrt{6}) \\ &= (a_1 + b_1) + (a_2 + b_2)\sqrt{2} + (a_3 + b_3)\sqrt{3} + (a_4 + b_4)\sqrt{6} \\ &\in \mathbb{F}_0 \\ a \times b &= (a_1 + a_2\sqrt{2} + a_3\sqrt{3} + a_4\sqrt{6}) \times (b_1 + b_2\sqrt{2} + b_3\sqrt{3} + b_4\sqrt{6}) \\ &= (a_1b_1 + 2a_2b_2 + 3a_3b_3 + 6a_4b_4) + (a_2b_1 + a_1b_2 + 3a_3b_4 + 3a_4b_3)\sqrt{2} \\ &\quad + (a_3b_1 + a_1b_3 + 2a_2b_4 + 2a_4b_2)\sqrt{3} + (a_4b_1 + a_1b_4 + a_2b_3 + a_3b_2)\sqrt{6} \\ &\in \mathbb{F}_0 \end{aligned}$$

- **可交换:** $\begin{cases} b + a = a + b \\ b \times a = a \times b \end{cases}$ (显然成立)
- **可结合:** $\begin{cases} (a + b) + c = a + (b + c) \\ (a \times b) \times c = a \times (b \times c) \end{cases}$ (显然成立)
- **可分配:** $\begin{cases} (a + b) \times c = (a \times c) + (b \times c) \\ c \times (a + b) = (c \times a) + (c \times b) \end{cases}$ (显然成立)
- **单位元 (不动点):** $\exists 0, 1 \in \mathbb{F}_0$ such that $\begin{cases} 0 \neq 1 \\ a + 0 = a \\ a \times 1 = a \end{cases}$

- **逆元:**

对于 $a \in \mathbb{F}_0$ ，我们可取 $(-a) = (-a_1) + (-a_2)\sqrt{2} + (-a_3)\sqrt{3} + (-a_4)\sqrt{6} \in \mathbb{F}_0$

它可使得 $(-a) + a = 0$

对于 $a \neq 0 \in \mathbb{F}_0$ (即有理数 a_1, a_2, a_3, a_4 不同时为零)

要找到一个逆元 $x = x_1 + x_2\sqrt{2} + x_3\sqrt{3} + x_4\sqrt{6} \in \mathbb{F}_0$ 使得 $a \times x = 1$ ，我们只需求解以下线性方程组：

$$\begin{cases} a_1x_1 + 2a_2x_2 + 3a_3x_3 + 6a_4x_4 = 1 \\ a_2x_1 + a_1x_2 + 3a_3x_4 + 3a_4x_3 = 0 \\ a_3x_1 + a_1x_3 + 2a_2x_4 + 2a_4x_2 = 0 \\ a_4x_1 + a_1x_4 + a_2x_3 + a_3x_2 = 0 \end{cases} \Leftrightarrow Ax = \begin{bmatrix} a_1 & 2a_2 & 3a_3 & 6a_4 \\ a_2 & a_1 & 3a_4 & 3a_3 \\ a_3 & 2a_4 & a_1 & 2a_2 \\ a_4 & a_3 & a_2 & a_1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} = e_1$$

但我们似乎无法证明 $\det(A) \neq 0$ ：

$$\begin{aligned}
\det(A) &= a_1 \begin{vmatrix} a_1 & 3a_4 & 3a_3 \\ 2a_4 & a_1 & 2a_2 \\ a_3 & a_2 & a_1 \end{vmatrix} - 2a_2 \begin{vmatrix} a_2 & 3a_4 & 3a_3 \\ a_3 & a_1 & 2a_2 \\ a_4 & a_2 & a_1 \end{vmatrix} + 3a_3 \begin{vmatrix} a_2 & a_1 & 3a_3 \\ a_3 & 2a_4 & 2a_2 \\ a_4 & a_3 & a_1 \end{vmatrix} - 6a_4 \begin{vmatrix} a_2 & a_1 & 3a_4 \\ a_3 & 2a_4 & a_1 \\ a_4 & a_3 & a_2 \end{vmatrix} \\
&= a_1(a_1^3 - 2a_1a_2^2 - 3a_1a_3^2 - 6a_1a_4^2 + 12a_2a_3a_4) \\
&\quad - 2a_2(a_1^2a_2 - 2a_2^3 + 3a_2a_3^2 + 6a_2a_4^2 - 6a_1a_3a_4) \\
&\quad + 3a_3(-a_1^2a_3 - 2a_2^2a_3 + 3a_3^3 - 6a_3a_4^2 + 4a_1a_2a_4) \\
&\quad - 6a_4(a_1^2a_4 + 2a_2^2a_4 + 3a_3^2a_4 - 6a_4^3 - 2a_1a_2a_3) \\
&= 48a_1a_2a_3a_4 + (a_1^4 + 4a_2^4 + 9a_3^4 + 36a_4^4) - (4a_1^2a_2^2 + 6a_1^2a_3^2 + 12a_1^2a_4^2 + 12a_2^2a_3^2 + 24a_2^2a_4^2 + 36a_3^2a_4^2)
\end{aligned}$$
